Relationships between Objects

Dependencies, Associations and Generalisations

COMP2603
Object Oriented Programming 1

Week 3, Lecture 2

Outline

- Variable vs Object Equality
- Types of Relationships in Object-Oriented Programming
  - Dependencies
  - Associations
  - Generalisations

Variable Assignment vs Equality

The symbol = is the assignment operator. It assigns the value on its right-hand side to the variable on its left-hand side.

The symbol == is the equality operator. It evaluates whether the expressions on its left- and right-hand sides have the same value and returns either true or false.

https://runestone.academy/ns/books/published/javajavajava/java-language-elements.html

Variable Equality - Example 1

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          int x = 10;
4          int w = 20;
5          if (x == w)// checks value at memory location
6              System.out.println("variables are equal");
7          else
8              System.out.println("variables are not equal");
9
10     }
11
12 }
```

What is printed?
(A) variables are equal
(B) variables are not equal

Variable Equality - Example 1

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          int x = 10;
4          int w = 20;
5          if (x == w)// checks value at memory location
6              System.out.println("variables are equal");
7          else
8              System.out.println("variables are not equal");
9
10     }
11
12 }
```

Week3Demo - Week3Code

BlueJ: Terminal Window - Week3Code

```
variables are not equal
```

Variable Equality - Example 2

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          double x = 4.0;
4          double w = Math.pow(2,2);
5          if (x == w)// checks value at memory location
6              System.out.println("variables are equal: "+ x +" = "+ w);
7          else
8              System.out.println("variables are not equal"+ x +" != "+ w);
9
10
11     }
12
13 }
```

What is printed?

(A) variables are not equal 4.0 != 2

(B) variables are not equal 4.0 != 4

(C) variables are equal 2 = 2

(D) variables are equal 4.0 = 4.0

Variable Equality - Example 2

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          double x = 4.0;
4          double w = Math.pow(2,2);
5          if (x == w)// checks value at memory location
6              System.out.println("variables are equal: "+ x +" = "+ w);
7          else
8              System.out.println("variables are not equal"+ x +" != "+ w);
9
10
11     }
12
13 }
```

Week3Demo - Week3Code

BlueJ: Terminal Window - Week3Code

```
variables are equal: 4.0 = 4.0
```

String Equality

The “==” operator only checks the referential equality of two Strings, meaning if they reference the same object or not.

https://www.baeldung.com/java-compare-strings

String Equality - Example 1

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = "def";
5          if (s1 == s2) // checks string literal
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```

String Equality - Example 1

Week3Demo - Week3Code

Week3Demo

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = "def";
5          if (s1 == s2) // checks string literal
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```

Week3Demo - Week3Code

BlueJ: Terminal Window - Week3Code

```
strings are not equal
```

String Equality - Example 2

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = "abc";
5          if (s1 == s2) // checks string literal
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```

Week3Demo - Week3Code

BlueJ: Terminal Window - Week3Code

```
strings are equal
```

String Equality - Example 3

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = new String("abc");
5          if (s1 == s2) // checks string object location
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```

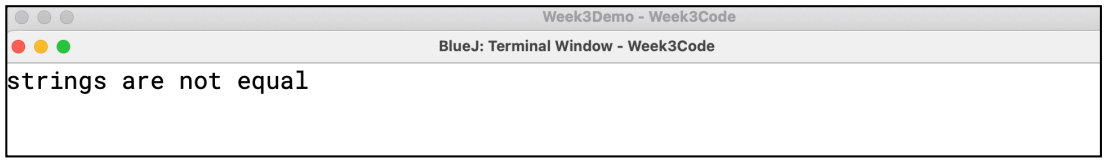
String Equality - Example 3

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = new String("abc");
5          if (s1 == s2) // checks string object location
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```



✘ But this output could be conceptually incorrect

String Equality - Example 4

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = new String("abc");
5          if (s1.equals(s2))// checks string characters; ignores location
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```

String Equality - Example 4

Week3Demo - Week3Code

Week3Demo

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          String s1 = "abc";
4          String s2 = new String("abc");
5          if (s1.equals(s2))// checks string characters; ignores location
6              System.out.println("strings are equal");
7          else
8              System.out.println("strings are not equal");
9          }
10
11 }
12
13
14
```

Week3Demo - Week3Code

BlueJ: Terminal Window - Week3Code

```
strings are equal
```

Why? Because the String class provides its own equals method

Object Equality

Consider the equals( ) method of the Object class:

```
public boolean equals(Object obj)
```

This method returns true if the current object is stored at the same memory address as `obj` and false otherwise.

This method behaves just like = =

Book.java

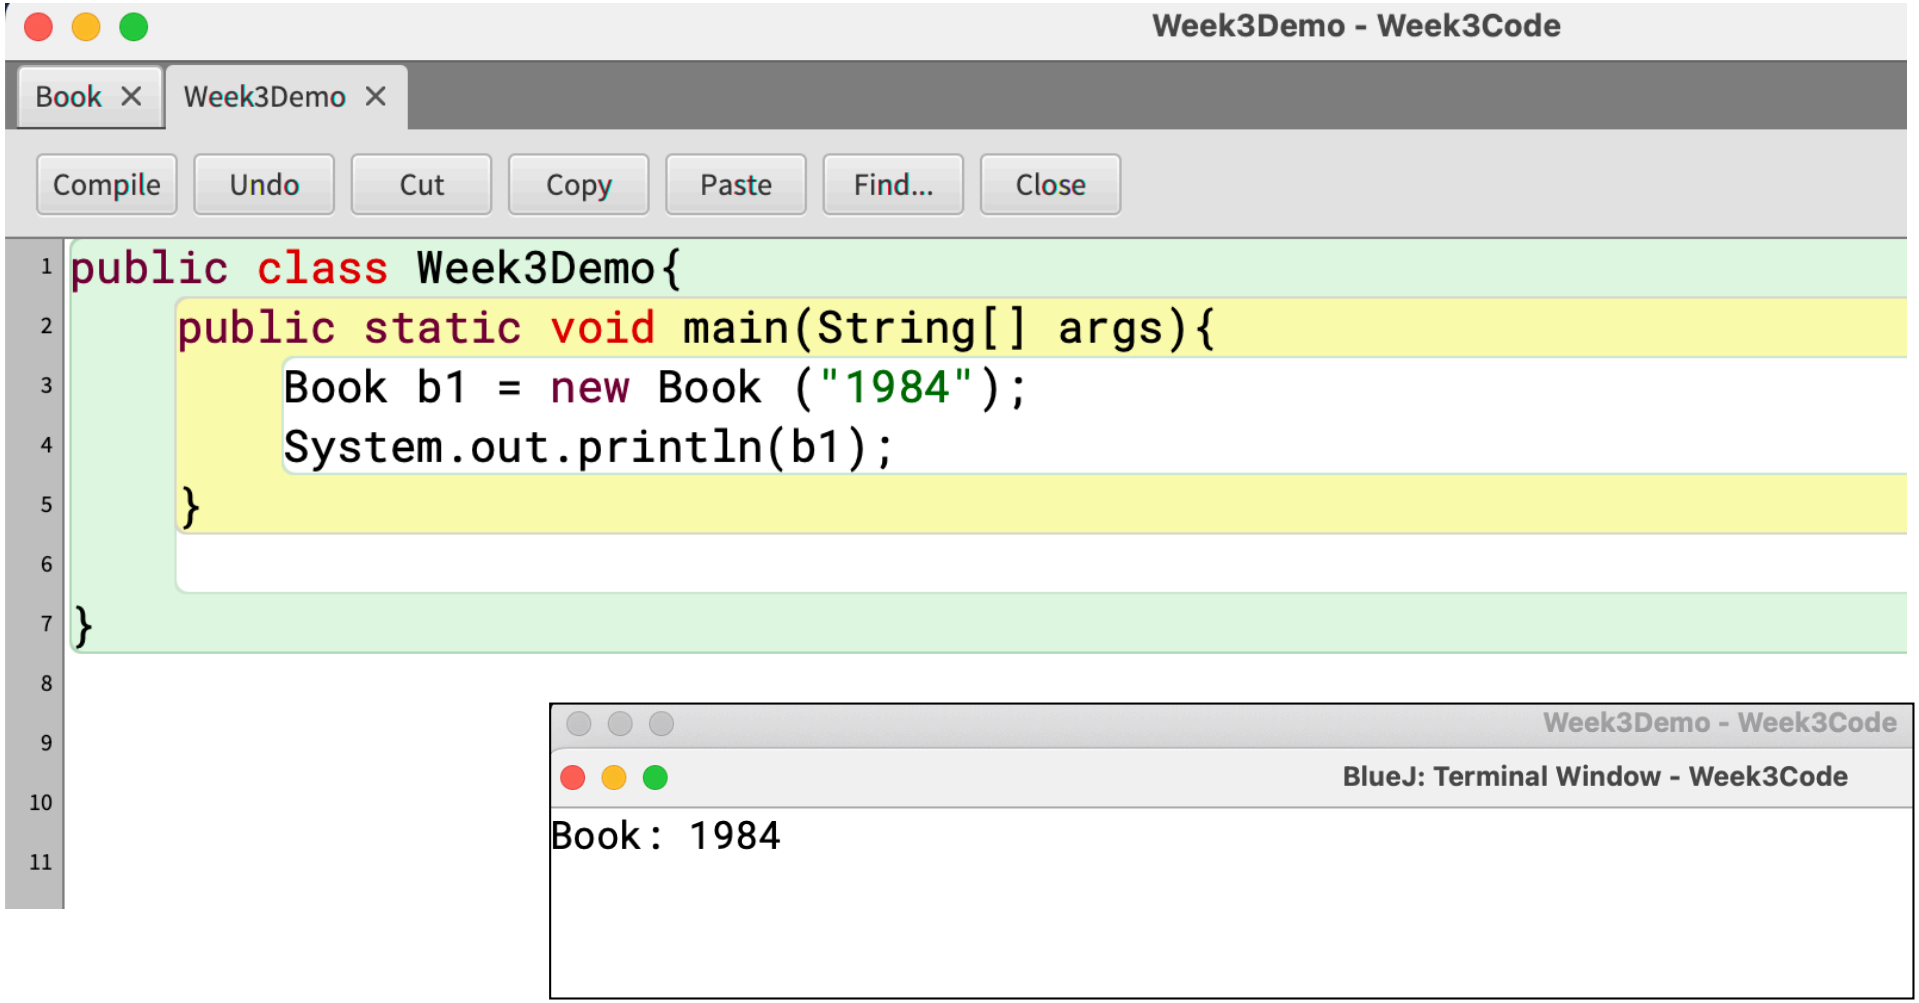
Book - Week3Code

Book ×

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Book{
2      private String title;
3      public Book(String title){
4          this.title = title;
5      }
6      public String getTitle(){
7          return title.toUpperCase();
8      }
9      public String toString(){
10         return "Book: " + getTitle();
11     }
12
13
14
```

Runner - Book.java



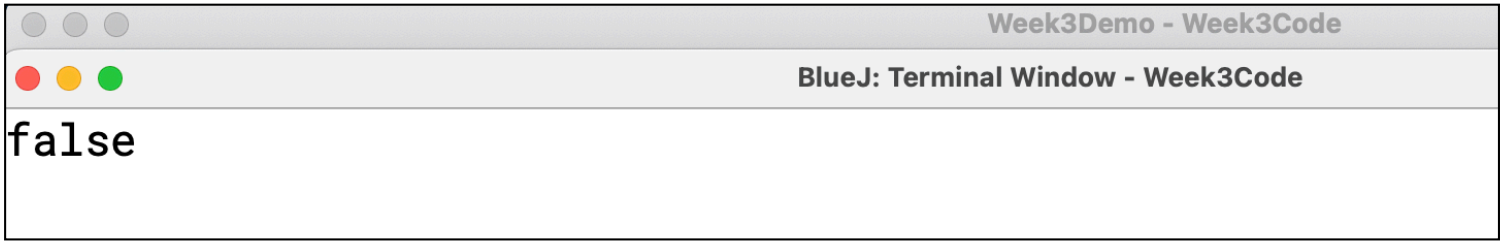
Runner - Book.java

Week3Demo - Week3Code

Book × Week3Demo ×

Compile Undo Cut Copy Paste Find... Close

```
1  public class Week3Demo{
2      public static void main(String[] args){
3          Book b1 = new Book ("1984");
4          Book b2 = new Book ("1984");
5          System.out.println(b1.equals(b2));
6      }
7
8  }
9
10
11
```



Why? Because the Object class provides an equals method.
It checks the memory location of the objects and compares those

Book.java - Custom equals( )

4          Book b2 = new Book ("1984", 8921);
5          System.out.println(b1.equals(b2));
6      }
7
8  }
9
```

Week3Demo - Week3Code

BlueJ: Terminal Window - Week3Code

```
false
```

Question

1. Indicate if the statement is TRUE/FALSE

(a) Primitive variables' equality is checked with the = symbol

(b) String equality should always be done with the == operator

(c) The default equals( ) method checks object state for equality

(d) An overridden/custom equals( ) method is never needed

Relationships

Classes, like objects, do not exist in isolation. Very often, an object-oriented program consists of a set of interacting objects whose classes are related in some way.

Relationships between classes are established to either:

- Indicate some sort of sharing between the classes
- Indicate a semantic connection between the classes

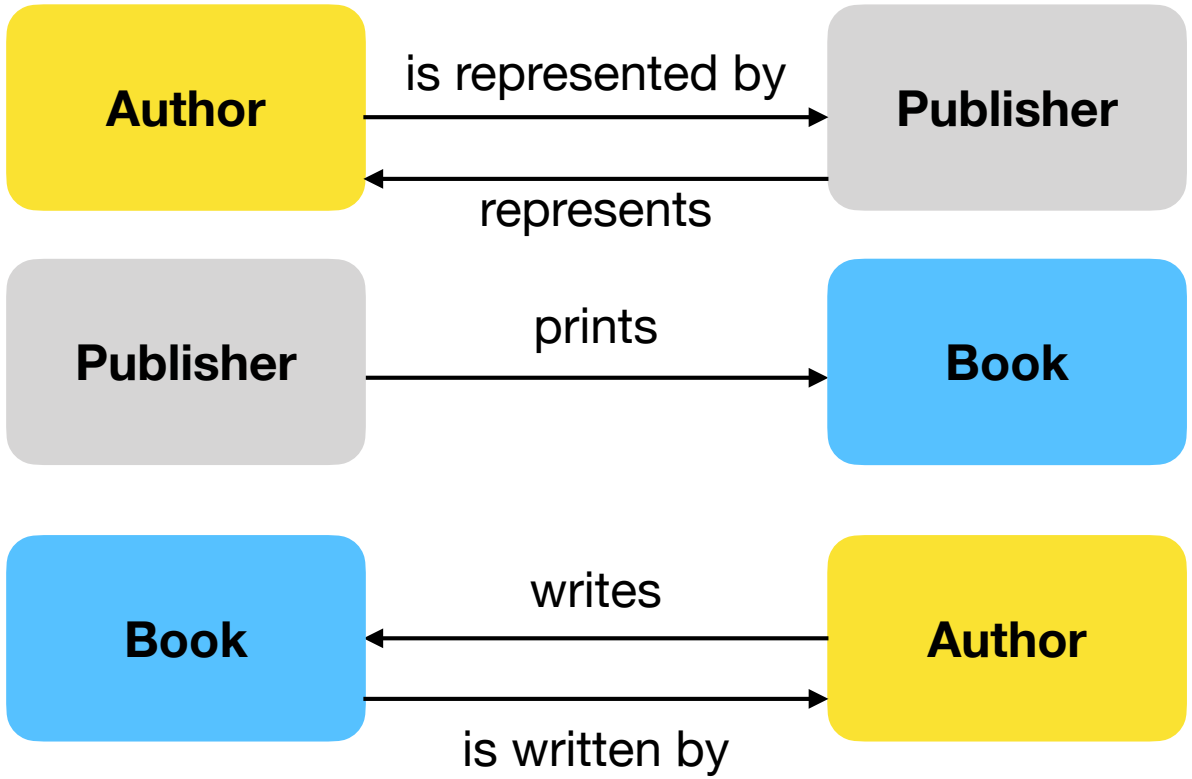
Kinds of Relationships

There are three basic kinds of relationships:

1. Association/Dependency (uses)
2. Generalisation/Specialisation (is-a)
3. Composition/Aggregation (part-of)

Associations

An association denotes a semantic dependency between objects. The direction of this association can be bidirectional or can be navigated specifically in one direction.



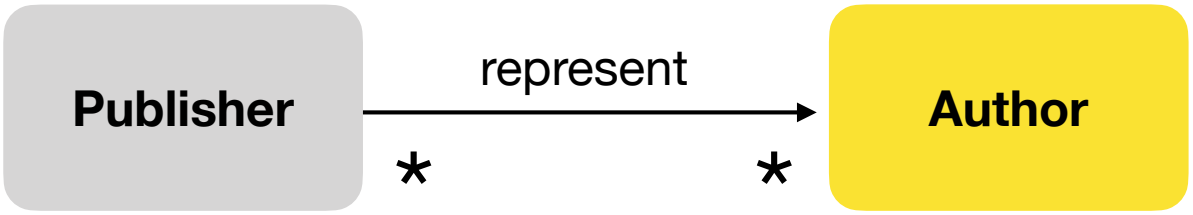
Cardinality

The cardinality of an association specifies the number of participants in the semantic relationship.

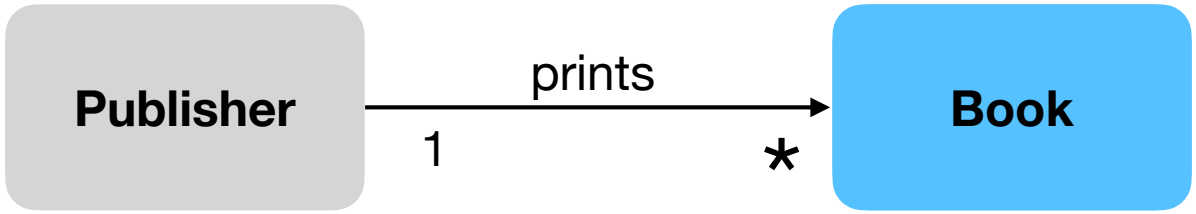
Three common types of cardinality are:

- One-to-one (narrow). (1-1)
- One-to-many (1-*)
- Many-to-many (*-*)

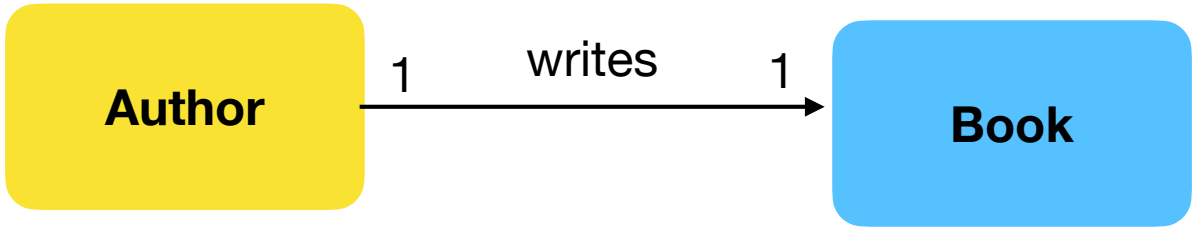
Example- Associations + Cardinalities



many-to-many association



one-to-many association



one-to-one association

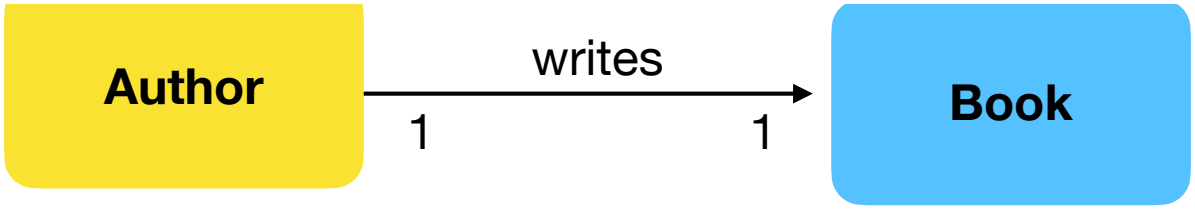
Example - Implementing Associations 1:1

Author - Week3Code

Book × | Week3Demo × | Author ×

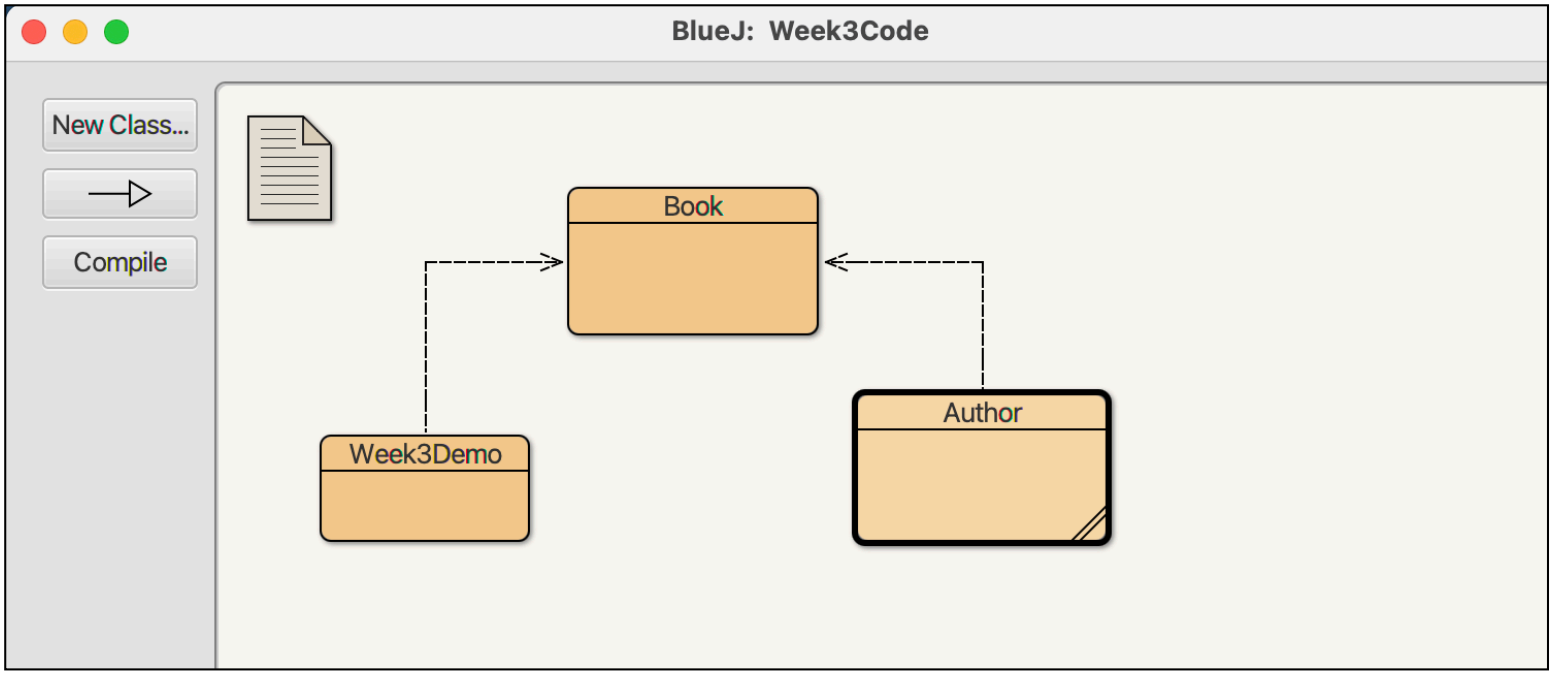
Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1 public class Author {
2     private Book myBook;
3     public Author (Book book){
4         myBook = book;
5     }
6 }
```



one-to-one association

Example - Implementing Associations 1:1



Example - Implementing Associations 1:1

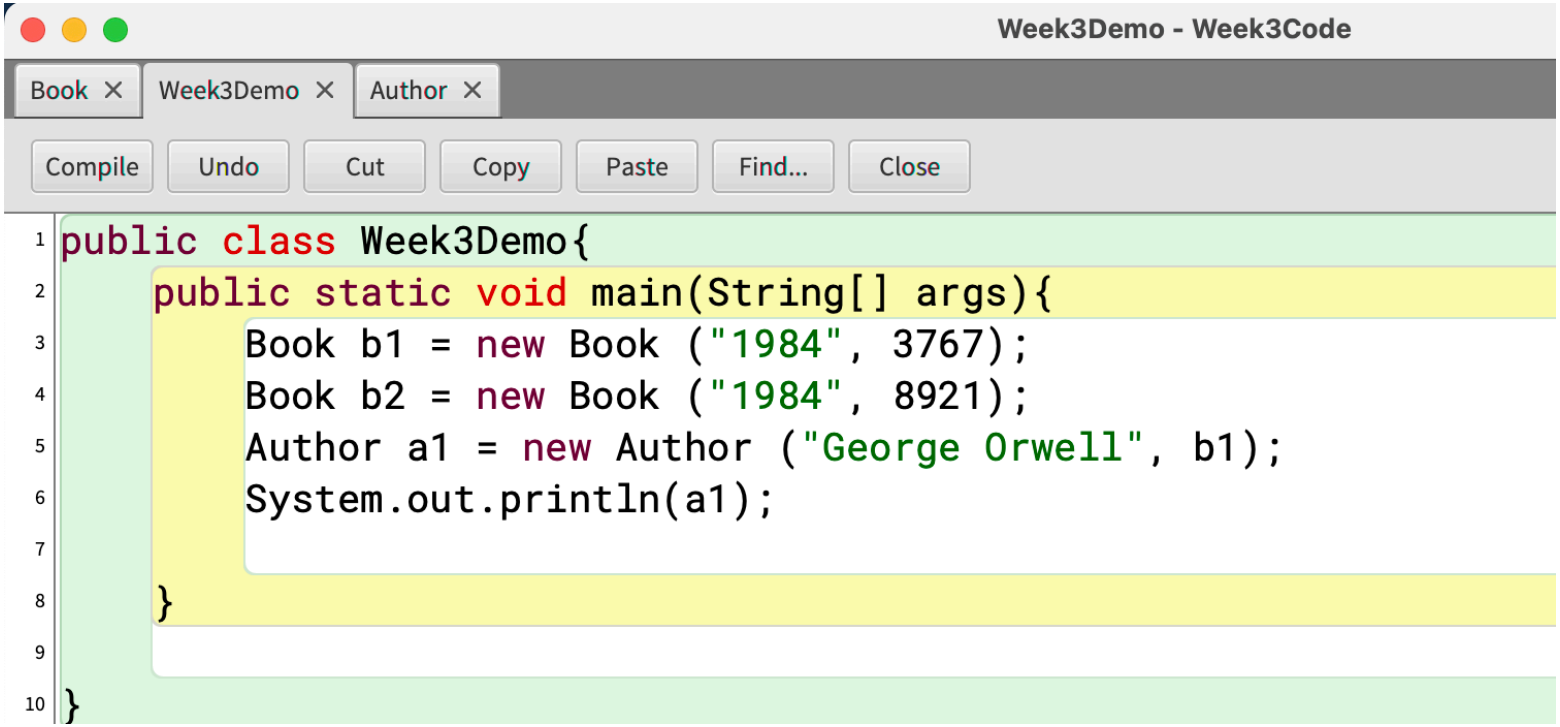
Author - Week3Code

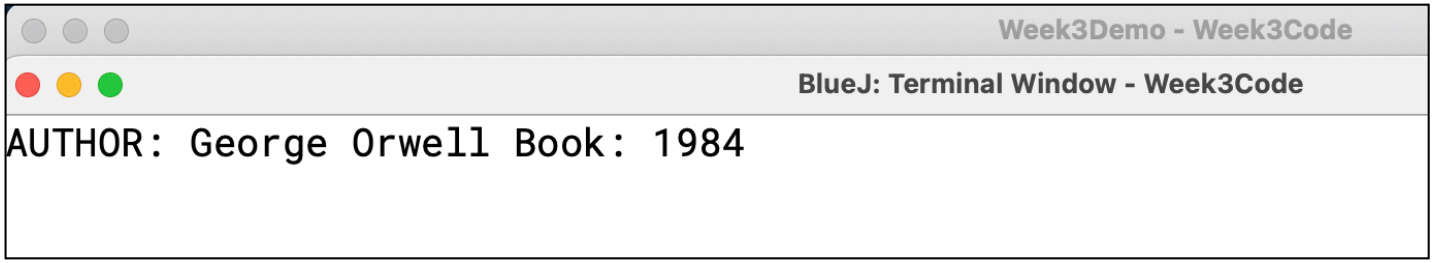
Book × | Week3Demo × | Author ×

Compile | Undo | Cut | Copy | Paste | Find... | Close

```
1  public class Author {
2      private Book myBook;
3      private String name;
4      public Author (String name, Book book){
5          this.name = name;
6          myBook = book;
7      }
8      public String toString( ){
9          return "AUTHOR: "+ name + " " +  myBook.toString();
10     }
11 }
```

Example - Implementing Associations 1:1





Question

1. Indicate if the statement is TRUE/FALSE

(a) One to one relationships are always bidirectional

(b) One to one relationships are implemented with a collection

(c) One to one relationships are created with object variables

(d) One to one relationships are dependencies between classes

Example - Implementing Associations 1: *

Publisher - Week3Code

11         Author a3 = new Author ("Jane Austin", b3);
12
13         Publisher p = new Publisher();
14         p.addBook(b1);
15         p.addBook(b2);
16
17         Publisher p2 = new Publisher();
18         p2.addBook(b3);
19
20         publishers.add(p);
21         publishers.add(p2);
22
23         System.out.println(publishers);
24     }
25 }
```

String Class

The String class is an immutable class. It has no mutators and it is impossible to change the state of the class after it has been created.

Several methods are available for use when you create a String object.

```
String s = “chickens”;
boolean plural = s.endsWith(“s”);
```

https://docs.oracle.com/javase/7/docs/api/java/lang/String.html

Summary

Today you learned about:

- Variable assignment vs equality
- Object equality and the equals( )
- String equality
- Types of Relationships in Object-Oriented Programming
  - Associations
    - 1:1
    - 1:Many
    - Many:Many
  - ArrayLists
